Agency on statistics of the Republic of Kazakhstan

Phone: 8 (7172) 749295
Fax: 8 (7172) 749509

The compendium is available on the internet-resource of the Agency on statistics www.stat. gov.kz

Conventional symbols:

the phenomena doesn't exist	"-"
statistical data not available	"…"
the phenomenon exists, but its value can not be rounded to a corresponding unit of measurement	"0,0"

The discrepancy between the totals and the sum in some cases can be explained by using rounded data.

Agency on Statistics of the Republic of Kazakhstan, 2012

Foreword

The present statistical compendium includes the macroeconomic indicators which give the comprehensive overview of the Republic of Kazakhstan's economy for 2006–2010, reflect the economic activities of the transactors, their relationships and results of their activities, give the possibility to have a full view of the resources available and their use in the economy of the country. All accounts are developed on the basis of the System of National Accounts (SNA-93).

The compendium consists of three sections.

The annual macroeconomic indicators and indicators of the System of National accounts are presented in the first section. In accordance to SNA-93 data are given by institutional sectors. Production and generation of income accounts are presented in details also by kinds of economic activity.

In the second section there are presented the quarterly data of gross domestic product by production approach and final uses approach for 2006–2010.

Gross regional product are published in the third section of the compendium.

Abbreviations

SNA	System of National Accounts
GDP	Gross domestic product
FISIM	Financial intermediate services indirectly measured
NPISHs	Non-profit institutions serving households

Part 1. SYSTEM OF NATIONAL ACCOUNTS

Methodological notes

The System of national accounts of the Republic of Kazakhstan is based on the SNA 93 international standart concepts. It is compiled with consideration of peculiarities and functioning of economy of the country.

Nowadays the goods and services account, production account, distribution and use of income accounts, accumulation accounts and financial account are being compiled in the Republic of Kazakhstan.

Goods and services account is a special summary table. Like all other accounts, it consists of two parts: on the «resources» side the output and imports of goods and services, taxes on products and imports, subsidies on products are recorded; on the «uses» side consumer expenditures on goods and services (intermediate and final), gross fixed capital formation, changes in inventories, and exports are recorded.

Production account records transactions directly linked to the production process. In this account the value added is defined, which is the basis for calculating of the gross domestic product, a main aggregate of the development of the economy.

Output is the total value of goods and services produced in the economy in the reporting period.

Intermediate consumption is equal to the value of goods and services, transformed or totally consumed in the current process of production. The intermediate consumption does not include consumption of fixed capital.

Intermediate consumption also covers payments of financial intermediate services indirectly measured (banks).

Gross value added is calculated at the level of the economy branches as the difference between output of goods and services and intermediate consumption. The term «gross» means, that the value added includes the value of fixed capital consumed in the process of production.

Taxes on products include taxes the rates of which directly depend on the value of goods produced and services rendered. Taxes on products include: value added tax (VAT), sales tax, excise tax, taxes on imported goods and services and others.

Subsidies on products are current unrequited payments from the state budget to enterprises provided to those enterprises, which are really producing particular goods and services.

Gross domestic product (GDP) by the production method is obtained by adding together values added by branches. Gross domestic product is calculated at market prices, i.e. includes net taxes on products and imports. The term «net» means that taxes are represented fewer related subsidies. It is one of the most important indicators of the System of National Accounts, characterizing the final result of economic activity of the country.

Generation of income account reflects primary incomes payable by resident institutional units directly engaged in the process of production of goods and services.

An institutional unit is considered to be a **resident** within a country when it has a point of economic interest on that territory, i.e. is engaged or is going to be engaged in some economic activities or transactions during a long period, usually assimilated to one year.

Compensation of employees is defined as remuneration, in cash and/or in kind, payable to employees for work completed during the accounting period. Compensation of employees is recorded on the basis of gross amounts and includes contributions to social insurance schemes, income tax deductions, and other payments, payable by employees, even if those are actually deducted by administration and paid directly to social insurance funds, tax services or any other institutions on behalf of the employees.

Other taxes on production consist of all taxes, excluding taxes on products, payable by enterprises in connection with their production process. The rates of these taxes do not directly depend on the volume and profitability of production.

They do not include any taxes on profit or other incomes received by institutional units. Other taxes on production include: taxes on use of natural resources (environmental tax), payment for land (land tax), licenses, state duties and levies payable by enterprises and organizations, real estate tax.

Gross (or net) operating surplus of the economy is the part of value added which remains with producers after deducting expenditures related to the compensation of employees and taxes on production. The terms «gross» and «net» in this case indicate that this indicator includes or excludes consumption of fixed capital in the production process.

Surplus generated as a result of production activity of the enterprises owned by households is called **«Gross mixed income»**, because it reflects both remuneration of work done by the owner of enterprise and entrepreneurial income.

Consumption of fixed capital is defined as the decline, during the accounting period, in the current value of fixed assets used in the process of production as a result of physical depreciation, obsolescence or accidental damages.

Allocation of primary income account characterizes primary income distribution obtained from the production activity or property among residential institutional units or sectors.

Property incomes include incomes receivable or payable by institutional units in connection with putting the financial assets, land, and other non-financial assets (minerals and other natural resources, patents, licenses, etc.) at the disposal of other institutional units.

Balance of primary incomes characterizes income receivable by institutional units as a result of their participation in production or from property. It is defined as the difference between all primary incomes receivable and payable by residential units. At the level of the total economy the balance of primary incomes calculated on gross basis, i.e. before deduction of fixed capital consumption, is equal to gross national income. The balance of primary incomes calculated on net

basis (after deduction of consumption of fixed capital) is equal to net national income.

Secondary distribution of income account reflects the transformation of the balance of primary incomes by sectors into their disposable incomes, as a result of receipts and payments of current transfers.

Transfer is defined as a transaction in which one institutional unit provides a good, service or asset (financial or non-financial) to another unit without receiving from the latter any good, service or asset in return. The current and capital transfers are being differed. They may be paid either in cash or in kind.

Current transfers include current taxes on income, wealth, etc.; social security contributions and benefits; voluntary payments and gifts of non-capital character, fines, etc.

Disposable income is defined as income left at institutional units' disposal for final consumption and saving. It is equal to the balance of primary incomes less income payable as current transfers plus current transfers' receivable. The sum of disposable incomes of all resident institutional units is equal to gross national disposable Income.

At the stage of use, gross domestic product is calculated **as the sum of final consumption of goods and services, gross capital formation and net exports (exports less imports).**

Use of disposable income account shows how households, general government and non-profit institutions serving households (NPISHs) distribute their disposable income between final consumption expenditures and saving.

Final consumption expenditures consist of final consumption expenditures of households, general government, final consumption expenditures on individual goods and services and collective services, and also final consumption expenditures of non-profit institutions serving households.

Such grouping shows, which sector pays for final consumption.

Final consumption expenditures of households include expenditures for purchasing consumer goods and services from all trade enterprises, city markets and through non-organized trade (street vendors), from public service enterprises, passenger transport, communications establishments, hotels, commercial institutions of culture, health care, education, and also other consumption of goods and services in kind, produced for own use (agricultural production of personal subsidiary plots, imputed services of owner-occupied dwellings), and received as labor remuneration.

General government final consumption expenditures on individual goods and services consist of expenditures of government institutions on consumer goods and services intended for personal consumption. Such expenditures are funded from the State budget and extra-budget funds.

General government final consumption expenditures on collective services include services rendered by the enterprises and organizations which meet needs not of separate households but of a whole community or its groups and are compensated from the State budget. This indicator includes expenditures on defense, general government, scientific activity, public services and services of institutions serving agriculture financed from the State budget.

Final consumption expenditures of non-profit institutions serving households are expenditures of public associations on consumer goods and services provided free to households. Also the services provided free by enterprises and organizations to their employees in education, health care and culture are included here.

The purpose of **the capital account** is to record the values of the non-financial assets that are acquired, or disposed of, by resident institutional units by engaging in transactions and to show the change in net worth due to saving and capital transfers.

Gross fixed capital formation is defined as resident units' investments in fixed assets aimed on new income generation in future for using it in the production process.

Changes in inventories comprise changes in productive stocks of semi-finished and finished products, and products for resale.

The value of changes in inventories during a given accounting period is equal to the difference between the value of inventories at the end and at the beginning of the period, estimated at average market prices of the examined period in order to eliminate the influence of prices.

Capital transfers are defined as free transfers of ownership of capital assets (other than inventories and cash) or finance for their acquisition from one institutional unit to another. Capital transfers are usually nonrecurring and considerable in value transactions connected with acquisitions or disposals of assets by participants of the transaction. They include taxes on capital, investment grants, other capital transfers.

Net lending (**+**) **or net borrowing** (–) is defined as the excess or deficit of the financial sources over the expenditures on net acquisition of non-financial assets. At the level of the economy, net lending or net borrowing shows the value of resources paid to the rest of the world and received from the rest of the world.

Financial account is an account that records transactions with financial assets and liabilities between institutional units and the rest of the world. On the left side of the account there is recorded acquisition minus retirement of financial assets, and on the right side there are liabilities assumed minus those cleared.

Monetary gold is a gold that is possessed by monetary accommodation authorities or other units, which are actually controlled by these authorities; it is a financial asset or a part of monetary reserves.

SDR (special drawing rights) are international reserve assets created by IMF and distributed among its members in addition to available reserve assets. SDR transactions are conducted according to financial accounts of monetary accommodation authorities and the rest of the world. SDR represent a guaranteed and absolute right of each holder for receipt of other reserve assets, in particular of foreign currency.

To the category of **securities** without shares related are bills, bonds, deposit certificates, commercial papers, unsecured debts, circulating financial derivatives and similar instruments, purchase and sale of which are usually carried out on the financial markets.

Shares and other forms of capital participation comprise all instruments and accounting documents that confirm (after satisfaction of demands of all creditors) demands for depreciated cost of corporations. The securities ensuring capital participation do not give right for obtaining the predetermined income or fixed amount when corporation is liquidated. As a rule, the ownership right is confirmed by shares, participation certificates or similar documents. This category comprises all preference shares that ensure participation in distribution of depreciated cost when corporate enterprise is liquidated.

Insurance technical reserves are subdivided into net value of household means in life insurance reserves and pension funds, preliminary premium contributions and reserves for covering of non-settled claims. In the first category included are reserves for coverage of insured risks, reserves for ensuring participation in the profits and pension funds reserves. The second category comprises preliminary premium contributions and reserves of insurance enterprises (including insurance of motor vehicles, medical insurance, life insurance for a definite period, personal accidents/injuries insurance, income insurance and other types of insurance, except for life insurance) for covering claim payments.

The category of **commercial credits and advances** includes:

Commercial credit for goods and services that is directly given to corporations, general government, non-commercial organisations, households and the rest of the world;

Advances for works in progress (if they are classified as such in the item of material inventories) or for those works that are to be carried out.

Net exports are defined as the difference between exports and imports and include the turnover of the trade of Kazakhstan with foreign countries, including the CIS countries.

Principles of evaluation. In the SNA, valuation is made at current prices used at the moment of transactions.

Production and use of GDP is valued at current market prices existing in the period of production or use of products.

Changes in inventories and consumption of fixed capital, are evaluated at average prices of the accounting period.

Non-market goods and services are evaluated at market prices of similar goods and services sold at the market when it is possible to determine them, or, by expenditures on production when market prices are not available (particularly, services of government and non-profit institutions are evaluated in this way).

Output, intermediate consumption and increase in inventories are calculated, **excluding holding gains (losses)**, which are defined as the value of products generated due to changes in prices during the period when the products were held in stocks. In the process of inflation the holding gains (losses) can be very high.

In order to eliminate the influence of various taxes and subsidies in different branches of the economy on the structure of production and generation of income, branch indicators are valued at basic prices.

Basic price is the amount receivable by the producer for a unit of a good or service excluding any taxes on products and imports, but including subsidies on products and imports.

Reevaluation at constant prices (of previous year) is made by two methods:

deflation of data at current prices for the accounting period by corresponding price indices;

extrapolation of data at current prices for the base year by volume indices or physical indicators.

To reevaluate the indicators of use of GDP at constant prices relevant price indices (consumer price index, capital investment price index, etc.) and physical indicators are applied.

GDP deflator index is the ratio of GDP at current prices to GDP at constant prices of the previous period. Unlike the goods and services prices index, the GDP deflator measures change in compensation of employees, operating surplus (including mixed income), and consumption of fixed capital resulting from changes in prices and nominal net taxes.

Part 2. QUARTERLY ESTIMATIONS OF GROSS DOMESTIC PRODUCT

Quarterly estimations of gross domestic product

This section contains quarterly estimates of GDP at current and constant prices by production approach and final uses approach for the period of 2006 until 2010.

The importance and necessity of the quarterly national accounts refer to the representation of the comprehensive information on economic development of the country for a short period. For purposes of economic decision making and analysis it is necessary to have a series of GDP quarterly data which would allow to monitor the economic development in a current period and to estimate the influence of the adopted measures and external factors, allowing at the same time to correct the undesirable tendencies in the economy.

The GDP estimates at current prices are calculated on a fixed base at the average prices of the base year; in this case the years 1994 and 2005 are considered as a base one. This allows comparing every quarter with the previous or any other quarter.

The constant prices concept. Any period (certain month, quarter or year) can be considered as a base period for an estimation at constant prices. But it is recommended to use a year as a base period since in a short period the prices can be affected by seasonal fluctuations. For example, in the third quarter, the share of agricultural production increases while the same annual figure is rather small. For creation of long series the estimates, calculated at constant prices of various base years, are reduced to one base by use of the chaining procedure.

According to the international requirements and for providing the qualitative tools of economic analysis it is necessary to make calculations on a discrete basis (non-cumulative basis) both at current and constant prices.

Two different approaches have to be considered when compiling the quarterly accounts:

one is based on annual data (when the annual estimates of national accounts are already available)

the other is based on quarterly data (with no annual estimates).

In the first case the annual national accounts have to be allocated among the quarters of the year, while in the second case the quarterly estimates have to be obtained by extrapolating the quarterly data with indices of volume and prices. The harmonization (correction) of the quarterly estimates with the annual estimates requires that the sum of the estimates for the four quarters will be equal to the annual estimate. Two main methods are distinguished for the compilation of quarterly accounts:

the direct method – the quarterly data (output, intermediate consumption, VA) at current prices are obtained straight from the reported data.

the indirect method – related indicators to the variable under estimation are used for extrapolation of the respective estimate of national accounts to the base year. The current price estimates are obtained by extrapolating the previous quarter's estimate at current prices by the combined indices of volume and prices.
