## Foreword

The statistical compilation presents information describing the dynamics of the state of the environment, the availability and use of natural resources. In order to more fully characterize the state of the environment, the collection publishes materials on the protection of atmospheric air, water, land, forestry, hunting resources, the formation and use of production and consumption waste, specially protected natural territories, information on environmental protection costs for 2016-2020.

Statistical compilation prepared by the Bureau of National statistics of the Agency for Strategic planning and reforms of the Republic of Kazakhstan on the basis of these forms of national statistical supervision received state statistics bodies of enterprises, organizations and the results of sampling and other forms of statistical observations, as well as information provided by the ministries and departments whose activities are related with nature management, environmental monitoring and environmental protection (Ministry of ecology and geology and natural resources of the Republic of Kazakhstan, Ministry of Energy of the Republic of Kazakhstan, the Ministry of Health of the Republic of Kazakhstan, Ministry of Agriculture of the Republic of Kazakhstan, Ministry of industry and infrastructure development of the Republic of Kazakhstan, Republican State Enterprise "Kazhydromet", JSC "Zhasyl Damu").

The compilation presents data on the environmental indicators recommended by the UNECE, and on the "green growth" indicators recommended by the OECD.

The compilation is intended for a wide range of users: economists, statisticians, employees of government bodies and financial and economic services, enterprises and organizations, scientists, entrepreneurs, the media.

## **Methodological notes**

Environment - a combination of natural and man-made objects, including atmospheric air, the ozone layer of the Earth, surface and underground waters, lands, subsoil, animal and plant world, as well as the climate in their interaction.

Environment – BBC with the topic of state and public measures aimed at the preservation and restoration of the environment, prevention of the negative impact of economic and other activity on the environment and the elimination of its consequences.

Current estimates of the population at the beginning of the year are calculated based on the results of the last census, to which the number of births and arrivals in a given territory is added each year and from which the number of deaths and departures from a given territory is subtracted. Current estimates of the population over the past years are updated on the basis of the results of the next census.

Natural population growth is equal to the difference in the number of births and deaths.

General birth and death rates - the ratio of the number of live-born and the number of deaths to the average annual population, multiplied by 1000.

Life expectancy at birth is the number of years that, on average, one person from the generation of births would have to live, provided that throughout this generation the mortality rate at each age remains the same as in the years for which the indicator is calculated.

Unemployment rate - the share of the number of unemployed in the labor force, measured as a percentage.

The mortality rate for the main classes of causes of death is calculated as the ratio of the number of deaths by the main classes of causes of death to the average annual population.

Maternal Mortality – Number of deaths of women from complications of pregnancy, child birth and the postpartum period per 100,000 live-born children.

Infant mortality – Number of children under 1 year per 1000 live births.

The incidence rate is determined by the ratio of the number of patients with the first established diagnosis to the average annual population.

Improvement of the housing stock – about Borum, the housing of individual residential premises by certain types of accomplishment: plumbing, sewage, central heating, gas, hot water, bathrooms, etc.

Living space is considered to be satisfied with Borum: running water, if the pipes are laid inside the dwelling. Water supply can be provided either from the central network or from an individual installation;

central heating, if the heating is carried out either by means of a central heating system or installation provided inside the building or dwelling and intended for heating purposes (regardless of the source of energy).

Gross domestic product at the production stage is determined by summing gross value added by industry. Gross domestic product is calculated at market prices, i.e. includes net taxes on products and imports. The term "net" means that taxes are shown net of related subsidies. This is one of the most important indicators of the system of national accounts, characterizing the final result of the economic activity of the country.

The production of an industrial enterprise in terms of value is the cost of products intended for the sale (marketing) of goods intended for further processing (semi-finished products of its own output and auxiliary and auxiliary production); works (services) of an industrial nature.

The volume of industrial production (goods and services) of the enterprise is determined by factory methods without the cost of intra-onBorumota. Works, services of an industrial nature are included in the volume of manufactured industrial products at their cost, including the cost of their own consumable materials.

The volume of products for industry as a whole and its types of activity is defined as the

sum of data on the volume of products. goods and services of an industrial nature. produced by legal entities and their separate subdivisions regardless of the form of ownership. Data on the volume of production are given in actual prices (excluding VAT and excise taxes).

The aggregate data on the volume of industrial products in general includes the volumes of products (goods. services) produced by large. medium. small and subsidiary enterprises (industrial divisions at non-industrial enterprises). the household sector. also carried out calculations of th volume of products for non-observed activities.

Total land area is the surface area of the land along with inland waters located within the state border.

Agricultural land - plots of land used to produce agricultural products. They include arable land. land under perennial crops. hayfields and pastures.

Arable land - systematically cultivated agricultural land used for sowing crops. including sowing of perennial grasses and pure couples.

Hayfields are agricultural land systematically used for haymaking.

Pastures are agricultural land systematically used for grazing animals (this is the main use). as well as land plots suitable for grazing livestock that are not used for haying and are not fallow.

Irrigated lands are lands that have a permanent irrigated network (canals. pipelines. trays) associated with irrigation sources whose water resources provide for irrigation of these lands.

Disturbed lands are lands that have lost their initial value due to economic activity and are a source of negative environmental impact.

Reclaimed lands - lands brought into a condition suitable for use on the farm (rural. forest. water. etc.) and transferred to land users by acts in accordance with the current procedure for transferring reclaimed land by enterprises. organizations and institutions developing mineral deposits and peat conducting exploration. survey. construction and other works related to the violation of the soil cover.

Sown area - arable land planted with crops. It consists of: winter crops of the past year minus the winter death; Spring. sown in the current year on an independent area. including the re-sowing of winter crops and perennial grasses of the current year (without cover); perennial grasses sowing past years in the area that will be harvested in the current year. i.e. cutting area. preserved by spring.

Gross harvest of crops - products produced (collected) from the entire area of crops of various crops. agricultural plantations or other agricultural land. Gross harvest of grain crops. sunflower. sugar beet (factory) is set in weight after processing (net. test weight). for the rest of the crops - in the original capitalized (bunker) weight.

Crop yields are an indicator characterizing the average harvest of agricultural products per unit area; calculated as the ratio of the gross collection to the harvested area. in centners per 1 hectare.

The number of livestock and poultry - the number of live livestock and poultry available in the farms at the end of the reporting period.

The average monthly air temperature is determined as follows: to ensure uniformity and reliability of the results of observations. all stations located on the territory of the Republic of Kazakhstan conduct observations in accordance with the requirements and provisions of the Guide to Meteorological Instruments and Methods of Observation. Only the devices recommended for the Kazhydromet network for the relevant type of measurement are used for measurements.

Meteorological observations at all observation stations are made in a single synchronous timeframe according to the Greenwich Mean Time (GMT). taken as the international (8 timelines every 3 hours): 18. 21. 0. 3. 6. 9. 12 and 15 hours SGW.

Meteorological measurements are carried out regularly during the year in each period. including air temperature and precipitation.

To eliminate uncertainty at meteorological stations. the temperature is measured at a height of 2 m from the underlying surface in a protective louver box. which serves to eliminate the influence of solar radiation and radiation from surrounding objects on instrument readings and to protect against precipitation and strong gusts of wind.

Monthly precipitation is determined as follows: precipitation is measured 2 times a day to get the quantity for the day and night half of the day at 3 and 15 h SGV and is measured continuously throughout the year.

The amount of precipitation is determined by the volume of liquid water. which is obtained by collecting the precipitation by a receiving vessel with a fixed receiving surface area.

Water pollution index - the value of the complex index of water pollution (WPI). which is calculated for 6 indicators using the formula

$$IZV6 = \frac{1}{6} (q_{cf,i} / PDK_i) / 6. \text{ where}$$

$q_{cf,i}$  - the average concentration of the i-th substance

$PDK_i$ -the average daily maximum allowable concentration of the i-th substance.

The maximum permissible concentration (MPC) of an impurity (substance) in water resources is the maximum concentration of an impurity in water sources that does not cause adverse effects for the population. flora and fauna with constant or periodic exposure.

Water abstraction - the volume of water withdrawals from surface (including the sea) water bodies and underground horizons for the purpose of further water consumption. The total volume of the fence includes used mine-mine water. obtained by mining. This indicator does not include the volume of water passing through waterworks for producing electricity. sluicing ships. passing fish. maintaining navigable depths. etc. Also. the volume of intake of transit water for supply to large canals is not taken into account.

Water loss during transportation - water loss from the place of intake to the place of consumption (use) for evaporation. filtration. leakage. etc. This does not include the amount of water transferred for use to a third-party consumer.

Water use - the use of water taken from various sources of water (including sea water) to meet household needs. This does not include recycled water consumption. as well as the reuse of waste and collector-drainage water.

Discharge of wastewater - the volume of discharge of all types of wastewater directly into water bodies. underground horizons. drainage depressions. as well as the transfer of wastewater to other enterprises (organizations). Filtration fields are equated to drainless depressions. from which treated wastewater is not diverted to water sources. The volume of wastewater also includes industrial. municipal. mine. mine and other similar waters (for irrigation systems. drainage and other waste waters). as well as wastewater received from the outside.

Contaminated wastewater is water that does not represent any further immediate value for the purpose for which it was used. due to its quality. quantity or time of entry. However. the wastewater of one consumer can serve as a potential source of water for another consumer somewhere else.

Circulating water supply is a system for re-supplying treated water to industrial needs after cleaning. cooling and processing. Circulating water supply is used to save water in production.

Wastewater treatment - treatment of wastewater in order to extract. remove. neutralize the impurities contained in them to the established standards. Various methods are used for wastewater treatment: mechanical. physicochemical. biological.

Regulatory-treated wastewater - wastewater that has been cleaned at the relevant facilities. the discharge of which after treatment into water bodies does not lead to a violation of water quality standards at a controlled site or water use point. i.e. the content of pollutants in this wastewater must comply with the approved maximum permissible discharge (MPD).

The maximum permissible discharge (MPD) is the maximum amount of substances in wastewater allowed for discharge at a given point of a water body in units of time that does

not violate the water quality standards at a given site (pond). In statistics. the ratio of actual discharge and MPD is the main indicator characterizing the degree (category) of wastewater contamination.

Atmospheric pollution index (API5) - the value of the complex index of atmospheric pollution. which is calculated for the five substances with the highest values.

$$IZA5 = \frac{q_{cf,i}}{MAC} C_i \text{ where}$$

$q_{cf,i}$  - the average concentration of the i-th substance

MAC - the average daily maximum allowable concentration of the i-th substance;

$C_i$  - coefficient depending on the hazard class of the i-th substance taken to be 1.7; 1.3; 0.1 and 0.9 respectively for hazard classes 1. 2. 3. and 4

The average concentration of the pollutant is calculated as the arithmetic average of the one-off concentrations measured during the year.

Maximum permissible concentration of impurities in the atmosphere (MPC) - the maximum concentration of impurities in the atmosphere. referred to a specific time of averaging. which. with periodic effects or throughout a person's life. does not adversely affect them. including long-term effects. as well as on the environment as a whole .

Emissions of air pollutants - the release into the air of pollutants (having an adverse effect on the health or activity of the population. on the environment) of substances from stationary (non-mobile) emission sources. All pollutants entering the atmospheric air are taken into account both after passing the dust and gas treatment facilities (as a result of incomplete capture and purification) at organized sources of pollution. and without purification from organized and unorganized sources of pollution. Accounting for emissions of air polluting substances is carried out both by the state of aggregation (the amount of solid. gaseous and liquid). and by individual substances (ingredients).

A stationary source of air pollution is a non-mobile technological unit (installation. device. apparatus. etc.) that releases harmful substances during operation. This includes other objects (heaps. reservoirs. etc.).

Purification of gases that pollute the atmosphere (trapping) - removal of harmful substances from the gas-air mixture. exhaust from sources of air pollution. with the help of special devices. installations and equipment; it also includes neutralization. reduction of toxicity. neutralization. afterburning. etc. harmful substances in waste (generated) gases. Statistical observation in this case does not cover technological processes in which the formed and captured (recyclable) substances in accordance with the regulations were originally provided for the production of any types of raw materials. semi-finished products or finished products.

Maximum permissible emission (MPE) is a scientific and technical standard established from the condition that the content of pollutants in the surface layer of air from a source or their combination does not exceed the standards of air quality for the population. animal and plant world.

Availability. formation. use of toxic waste - accounting for the amount of formed. used. neutralized production and consumption wastes that pose a threat to public health and biological resources. All types of industrial toxic wastes that include harmful substances are considered

Waste disposal - operations for the disposal and destruction of waste.

Waste storage - storage of waste in designated areas for the purpose of their safe disposal.

Waste removal - storage of waste in places specially designated for its safe storage for an unlimited period.

Waste recycling - the use of waste as secondary material or energy resources.

The forest fund is a part of the territory of a country (region) occupied by the forest. as well as unoccupied by it. but intended for the needs of forestry. The forest fund includes forest area. i.e. the territory covered with forest (actually occupied by tree species forming the

stands) and uncovered by the forest. but intended for growing (burning. cutting. wasteland. clearing. openings. area of dead stands).

A forested area is the area actually occupied by tree species forming the plantations.

Reforestation - carrying out activities for the restoration of forests in cuttings. burns. wastelands. glades and other areas under the forest. Reforestation includes planting. sowing forests and promoting natural regeneration.

Thinning forest - periodic felling in plantations of the trees and shrubs. carried out since the formation of the desired composition. forms of plantings and increase growth.

The State Natural Conservancy area is a specially protected natural area. intended to preserve and study in its natural state and development of natural processes. typical and unique ecological systems. biological diversity and the genetic stock of the flora and fauna.

The State National Natural Park is a specially protected natural area intended for the preservation. restoration and multi-use of natural. historical and cultural complexes and objects of particular ecological. recreational and scientific value..

The State Natural Reserve is a specially protected natural area with different protection regimes. designed to preserve and restore landscape and biological diversity. ensure sustainable development and a balanced use of natural resources in a given territory.

Area of hunting grounds - lands occupied by forests. water and farmland. which serve as habitats for wild animals and birds and can be used for hunting.
