in percent

#### 4. Glossary

Gross domestic product (GDP) is one of the most important indicators of the system of national accounts, characterizing the final result of the country's economic activity.

Gross value added is the value of gross output minus the value of intermediate consumption, which serves as an indicator of the contribution to GDP made by individual producers, industries or sectors of the economy.

Gross output is the output of goods and services, representing the total value of goods and services resulting from the production activities of resident units of the national economy in the reporting period.

Intermediate consumption is the value of goods and services that are transformed or completely consumed in the production process.

A deflator is an indicator that characterizes the average change in prices in the economy over a certain period.

Contribution - the value of the influence of the percentage change in the indicator on the total value of GDP.

Taxes on products include taxes, the amount of which directly depends on the cost of goods produced and services rendered.

#### 5. Methodological notes

Gross domestic product by production is the sum of gross value added by economic activity, which is increased by net taxes on products and on imports. The term "net" means that taxes are shown net of related subsidies.
